

# [MS-HGRP-Diff]: HomeGroup Protocol

---

## Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation (“this documentation”) for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](#).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](http://www.microsoft.com/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

## Revision Summary

Date	Revision History	Revision Class	Comments
1/29/2010	0.1	Major	First Release.
3/12/2010	1.0	Major	Updated and revised the technical content.
4/23/2010	1.0.1	Editorial	Changed language and formatting in the technical content.
6/4/2010	2.0	Major	Updated and revised the technical content.
7/16/2010	3.0	Major	Updated and revised the technical content.
8/27/2010	4.0	Major	Updated and revised the technical content.
10/8/2010	4.0	None	No changes to the meaning, language, or formatting of the technical content.
11/19/2010	5.0	Major	Updated and revised the technical content.
1/7/2011	5.0	None	No changes to the meaning, language, or formatting of the technical content.
2/11/2011	5.0	None	No changes to the meaning, language, or formatting of the technical content.
3/25/2011	5.0	None	No changes to the meaning, language, or formatting of the technical content.
5/6/2011	5.0	None	No changes to the meaning, language, or formatting of the technical content.
6/17/2011	6.0	Major	Updated and revised the technical content.
9/23/2011	6.0	None	No changes to the meaning, language, or formatting of the technical content.
12/16/2011	7.0	Major	Updated and revised the technical content.
3/30/2012	7.0	None	No changes to the meaning, language, or formatting of the technical content.
7/12/2012	7.1	Minor	Clarified the meaning of the technical content.
10/25/2012	7.1	None	No changes to the meaning, language, or formatting of the technical content.
1/31/2013	7.1	None	No changes to the meaning, language, or formatting of the technical content.
8/8/2013	8.0	Major	Updated and revised the technical content.
11/14/2013	8.1	Minor	Clarified the meaning of the technical content.
2/13/2014	8.1	None	No changes to the meaning, language, or formatting of the technical content.
5/15/2014	8.1	None	No changes to the meaning, language, or formatting of the technical content.
6/30/2015	9.0	Major	Significantly changed the technical content.

Date	Revision History	Revision Class	Comments
10/16/2015	9.0	None	No changes to the meaning, language, or formatting of the technical content.
7/14/2016	9.0	None	No changes to the meaning, language, or formatting of the technical content.
<u>6/1/2017</u>	<u>9.0</u>	<u>None</u>	<u>No changes to the meaning, language, or formatting of the technical content.</u>

# 1 Introduction

This document specifies the HomeGroup Protocol, which is used to create a trust relationship that facilitates the advertising and publishing of content between machines via a peer-to-peer (P2P) infrastructure.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

## 1.1 Glossary

This document uses the following terms:

**Advanced Encryption Standard (AES):** A block cipher that supersedes the Data Encryption Standard (DES). AES can be used to protect electronic data. The AES algorithm can be used to encrypt (encipher) and decrypt (decipher) information. Encryption converts data to an unintelligible form called ciphertext; decrypting the ciphertext converts the data back into its original form, called plaintext. AES is used in symmetric-key cryptography, meaning that the same key is used for the encryption and decryption operations. It is also a block cipher, meaning that it operates on fixed-size blocks of plaintext and ciphertext, and requires the size of the plaintext as well as the ciphertext to be an exact multiple of this block size. AES is also known as the Rijndael symmetric encryption algorithm [FIPS197].

**device-independent bitmap (DIB):** A container for bitmapped graphics, which specifies characteristics of the bitmap such that it can be created using one application and loaded and displayed in another application, while retaining an identical appearance.

**FMTID:** A GUID value that identifies a property set format.

**globally unique identifier (GUID):** A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122] or [C706] must be used for generating the GUID. See also universally unique identifier (UUID).

**homegroup:** A group of one or more computers that are AES joined together by using Advanced Encryption Standard (AES) through the HomeGroup Protocol, which are able to share resources (files, printers, and so on) with each other.

**Internet Protocol version 6 (IPv6):** A revised version of the Internet Protocol (IP) designed to address growth on the Internet. Improvements include a 128-bit IP address size, expanded routing capabilities, and support for authentication and privacy.

**little-endian:** Multiple-byte values that are byte-ordered with the least significant byte stored in the memory location with the lowest address.

**Media Access Control (MAC) address:** A hardware address provided by the network interface vendor that uniquely identifies each interface on a physical network for communication with other interfaces, as specified in [IEEE802.3]. It is used by the media access control sublayer of the data link layer of a network connection.

**PeerGroup:** A group of one or more machines connected through the Peer-to-Peer Grouping Security Protocol [MS-PPSEC].

**peer-to-peer:** A server-less networking technology that allows several participating network devices to share resources and communicate directly with each other.

**Rivest-Shamir-Adleman (RSA):** A system for public key cryptography. RSA is specified in [PKCS1] and [RFC3447].

**service set identifier (SSID):** A sequence of characters that names a wireless local area network (WLAN).

**SHA-256:** An algorithm that generates a 256-bit hash value from an arbitrary amount of input data, as described in [FIPS180-2].

**SHA-256 hash:** The value computed from the hashing function described in [FIPS180-3].

**Universal Naming Convention (UNC):** A string format that specifies the location of a resource. For more information, see [MS-DTYP] section 2.2.57.

**Web Services on Devices (WSD):** A function-discovery protocol used to discover and communicate certain data structures in a HomeGroup network environment. Implementation details are specified in [DPWS].

**wireless access point (WAP):** A wireless network access server (NAS) that implements 802.11.

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

## 1.3 Overview

The HomeGroup Protocol is used to create a trust relationship that facilitates the advertising and publishing of content between machines via a peer-to-peer infrastructure. <1><2> This relationship is achieved with the use of Web Services on Devices (WSD) and a PeerGroup infrastructure. There is no client-server relationship in this protocol; in order to participate in a homegroup, all machines implement the protocol in the same manner. For more information, see [HomeGroupOvw].

### 1.3.1 Role of Web Services on Devices (WSD)

WSD is used to publish messages that are discoverable to all machines on the subnet. These messages include the HomeGroup Invitation (section 2.2.1.1) and Shared Printer (section 2.2.1.2) messages.

### 1.3.2 Role of the PeerGroup

The PeerGroup is used as a secure line of communication between homegroup members.

### **1.3.3 High Level Homegroup Events**

#### **1.3.3.1 Creating a Homegroup**

A machine that attempts to create a homegroup accomplishes this by first creating a PeerGroup, which is the secure peer-to-peer connection through which the homegroup is synchronized, as outlined in [MS-PPSEC]. This homegroup machine sets the homegroup password, which is used to secure the homegroup. Once the PeerGroup has been created, this first machine publishes an invitation to the homegroup via WSD, which allows new machines on the subnet to discover the homegroup.

#### **1.3.3.2 Discovering and Joining the Homegroup**

A machine detects that there is a homegroup on the subnet by receiving a HomeGroup Invitation message (section 2.2.1.1) over WSD. With the invitation and the correct homegroup password, the machine is able to join the PeerGroup, and by extension, the homegroup.

### **1.4 Relationship to Other Protocols**

This protocol depends on [DPWS] to enable the discovery of a homegroup on the subnet, and [MS-PPSEC] to create a PeerGroup for communication between members of the homegroup. These two protocols are used independently of each other; that is, neither protocol sits above the other in the relationship hierarchy.

This protocol also requires that all machines implement the Internet protocol version 6 (IPv6) protocol.

### **1.5 Prerequisites/Preconditions**

The prerequisites for this protocol include those for the WSD, as described in [DPWS], and PeerGroup, as described in [MS-PPSEC].

In addition, this protocol requires the following:

- The underlying PeerGroup is restricted to machines on the same subnet.
- All members of the homegroup are required to have an IPv6 address and to be able to support the cryptography technology defined in section 3.1.4.5.

### **1.6 Applicability Statement**

The HomeGroup Protocol specifies a protocol for the creation of a trust relationship that facilitates the advertisement and publishing of content between machines on the same subnet.

### **1.7 Versioning and Capability Negotiation**

This document describes version 1 of this protocol, therefore there are no issues with capability negotiation. This protocol does provide versioning capability within the HomeGroup Record message (section 2.2.2.2) in both the <SOURCEOS> and <VERSION> elements.

### **1.8 Vendor-Extensible Fields**

None.

## 1.9 Standards Assignments

None.

## 2 Messages

### 2.1 Transport

Transport for this protocol is achieved through two channels: the PeerGroup and WSD, both of which are independent of the other. WSD is used to publish messages that are available to all machines on the subnet. The PeerGroup is used for sending secure communication between members of the homegroup.

### 2.2 Message Syntax

All messages are generated in XML format. The following sections use the terminology *sections*, *keys*, and *values* to specify concrete syntax for each message. This specification uses globally unique identifiers (GUIDs), as specified in [MS-DTYP] section 2.3.4.3.

#### 2.2.1 WSD Messages

All messages described in this section MUST be transported using WSD and published to the local subnet. The HomeGroup Protocol uses WSD messages to advertise the presence of a homegroup, as well as shared resources on the home network.

##### 2.2.1.1 HomeGroup Invitation

The HomeGroup Invitation message is used to advertise the presence of the homegroup to other machines on the home network and to provide the required details to allow them to join that homegroup. This message has the WSD type of: HomeGroup\_Invitation.

The HomeGroup invitation includes the PeerGroup invitation (which is required to join the PeerGroup) and other relevant information about the homegroup, as described in this section. The invitation is serialized into an XML string and then published on the local subnet using WSD.

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="NewDataSet" xmlns="" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:msdata="urn:schemas-microsoft-com:xml-msdata">
  <xs:element name="HOMEGROUP_RECORD">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="INVITATION" type="xs:string" minOccurs="1" />
        <xs:element name="NETWORKNAME" type="xs:string" minOccurs="0" />
        <xs:element name="GUIDNAME" type="xs:string" minOccurs="1" />
        <xs:element name="OWNER" type="xs:string" minOccurs="0" />
        <xs:element name="OWNERID" type="xs:string" minOccurs="0" />
        <xs:element name="OWNERMACHINE" type="xs:string" minOccurs="0" />
        <xs:element name="LASTCHANGED" type="xs:string" minOccurs="1" />
        <xs:element name="HOMEGROUPSIZE" type="xs:string" minOccurs="1" />
        <xs:element name="ADDRESS" type="xs:string" minOccurs="1" />
        <xs:element name="DIGITALHASH" type="xs:string" minOccurs="1" />
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element ref="HOMEGROUP_RECORD" />
      </xs:choice>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

</xs:schema>

**INVITATION:** The actual invitation from the PeerGroup. The format for this message and the manner in which it is generated is described in [MS-PPSEC].

**NETWORKNAME:** If any member of the homegroup is connected wirelessly to the network, this value is the service set identifier (SSID) of the wireless access point (WAP). If all machines are wired, then this value is NULL. The value for this element is the same across all of the homegroup members. If a new member of the homegroup is the first to use WAP, then this element is updated to reflect the SSID of the WAP.

**GUIDNAME:** A unique GUID that represents this homegroup. The value is the same for all homegroup members, and is generated when the PeerGroup is created [MS-PPSEC].

**OWNER:** The name of the user who last reset the pin on this homegroup, or if the pin has never been reset, it is the User who created the homegroup. The value is the same for all homegroup members.

**OWNERID:** The Peer Identity of the machine where the owner user resides [MS-PPSEC]. The value is the same for all homegroup members.

**OWNERMACHINENAME:** The machine name of the machine that created the homegroup. The value is the same for all homegroup members.

**LASTCHANGED:** The Int64 text representation of a FILETIME structure that represents the last time the pin was reset, or if never reset, the time that the homegroup was originally created, as described in [MS-FSCC]. The value is the same for all homegroup members.

**HOMEGROUPSIZE:** The number of members in the PeerGroup, and by extension, the homegroup. This is expressed as an integer value.

**ADDRESS:** The IPv6 addresses of the network adapter to which the PeerGroup is connected. This list of addresses is semicolon-delimited and can be specified using any valid IPv6 address format, as described in [RFC3513]

**DIGITALHASH:** The values contained in the <NETWORKNAME> (if not empty), <GUIDNAME>, <OWNER> (if not empty), <OWNERID> (if not empty), <OWNERMACHINENAME> (if not empty), <LASTCHANGED>, <HOMEGROUPSIZE>, and <ADDRESS> elements that are hashed together and then signed using the homegroup signing keys. The signing and hashing process is described in section 3.1.4.5.3.

### 2.2.1.2 Shared Printer

The Shared Printer message is used to advertise printers that are installed on the advertising machine. It is serialized into an XML string and then published on the local subnet using WSD. This message has the WSD type of: HomeGroup\_Printer.

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="HomeGroup"
targetNamespace="http://schemas.microsoft.com/windows/2007/HomeGroup/Printing"
xmlns:mstns="http://schemas.microsoft.com/windows/2007/HomeGroup/Printing"
xmlns="http://schemas.microsoft.com/windows/2007/HomeGroup/Printing"
xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns:msdata="urn:schemas-microsoft-com:xml-
msdata" attributeFormDefault="qualified" elementFormDefault="qualified">
  <xs:element name="HomeGroup" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element name="Printer">
          <xs:complexType>
            <xs:sequence>
```

```

        <xs:element name="Name" type="xs:string" minOccurs="1" />
    </xs:sequence>
</xs:complexType>
</xs:element>
</xs:choice>
</xs:complexType>
</xs:element>
</xs:schema>

```

**NAME:** The name of the printer being shared. It MUST be a valid printer name, as defined in [MS-RPRN] section 2.2.4.14.

This message is signed and encoded before being sent, as described in section 3.1.4.5.4.

## 2.2.2 PeerGroup Messages

All messages described in this section MUST be transported using PeerGroup. PeerGroup messages are used for secure communication between members of the homegroup. All messages sent via the PeerGroup are converted to binary before being sent.

### 2.2.2.1 HomeGroup Member Info

HomeGroup Member Info messages are used to broadcast a homegroup member's machine name and Peer ID.

```

<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="NewDataSet" xmlns="" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:msdata="urn:schemas-microsoft-com:xml-msdata">
  <xs:element name="HOMEGROUP_RECORD">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="COMPUTERNAME" type="xs:string" minOccurs="1" />
        <xs:element name="PEERID" type="xs:string" minOccurs="1" />
        <xs:element name="RECORDID" type="xs:string" minOccurs="1" />

        <xs:element name="property" minOccurs="0" maxOccurs="2">
          <xs:complexType>
            <xs:attribute name="type" type="xs:string" use="required"/>
            <xs:sequence>
              <xs:element name="name" type="xs:string" minOccurs="1" maxOccurs="1"/>
              <xs:element name="value" type="xs:string" minOccurs="1" maxOccurs="1"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element ref="HOMEGROUP_RECORD" />
      </xs:choice>
    </xs:complexType>
  </xs:element>
</xs:schema>

```

**COMPUTERNAME:** The machine name of the machine that is sending the message [MS-DTYP].

**PEERID:** The Peer Identity of the machine that is sending the message [MS-PPSEC].

**RECORDID:** A GUID-formatted string. This element SHOULD be an all null GUID formatted as: {00000000-0000-0000-0000-000000000000}. This element can be populated with another GUID-formatted string, but it MUST contain a value.

**property:** An optional element that consists of a name/value pair containing information about the homegroup member.<3>

**property.type:** A numeric representation of the data type for the value contained in the <property> element. The specified number corresponds to a **Property Type** value as described in [MS-OLEPS] section 2.14.1.

**property.name:** The name of the property contained in the <property> element.

**property.value:** The value of the property contained in the <property> element, the data type of which is specified in the <property.type> element.<4>

### 2.2.2.2 HomeGroup Record

The HomeGroup Record format is the base data structure that is used by the PeerGroup messages described in this section. Each subtype of message uses the HomeGroup Record to contain its relevant data. These records are structured by using the following format:

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="NewDataSet" xmlns="" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:msdata="urn:schemas-microsoft-com:xml-msdata">
  <xs:element name="HOMEGROUP_RECORD">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="VERSION" type="xs:string" minOccurs="1" />
        <xs:element name="RECORDSOURCE" type="xs:string" minOccurs="1" />
        <xs:element name="RECORDID" type="xs:string" minOccurs="1" />
        <xs:element name="EVENTTYPE" type="xs:string" minOccurs="1" />
        <xs:element name="FLAGS" type="xs:string" minOccurs="1" />
        <xs:element name="SOURCEOS" type="xs:string" minOccurs="1" />
        <xs:element name="PERSIST" type="xs:string" minOccurs="1" />
        <xs:element name="MACHINE" type="xs:string" minOccurs="1" />
        <xs:element name="PEERID" type="xs:string" minOccurs="1" />
        <xs:element name="HOMEGROUP_DATA" type="xs:string" minOccurs="1" />
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element ref="HOMEGROUP_RECORD" />
      </xs:choice>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

**VERSION:** Denotes the version of the HomeGroup Protocol. The current version, as described in this, document is version one. The value of this element SHOULD be set to 1 for all messages.

**RECORDSOURCE:** Identifies the type of record being sent and is unique for each message type. For example, the HomeGroup Credentials message (section 2.2.2.2.1) will populate this element with a string in GUID format.

**RECORDID:** This element SHOULD be an all null GUID formatted as: {00000000-0000-0000-0000-000000000000}. This element can be populated with another GUID-formatted string, but it MUST contain a value.

**EVENTTYPE:** MUST be set to 0 for all messages.

**FLAGS:** MUST be set to 0 for all messages.

**SOURCEOS:** This value identifies the source operating system. In the current version of this protocol, this value SHOULD be set to 100728832 for all messages.

**PERSIST:** Determines if the record will persist on the PeerGroup after the machine that created the record has departed from the PeerGroup. The value SHOULD be set to either 1 (True) or 0 (False).

**MACHINE:** The machine name of the record creator.

**PEERID:** The PeerID of the machine that creates the record [MS-PPSEC].

**HOMEGROUP\_DATA:** This element is used to transmit the data of the message subtypes and is populated by individual messages.

### 2.2.2.2.1 HomeGroup Credentials

HomeGroup Credentials messages are used to synchronize homegroup credentials that are common to all homegroup members. This message contains the common credential name, its password, and its creation time.<5>

The password is encrypted using the HomeGroup Encryption Key (section 3.1.4.5.1), and the creation time is used to decide conflicts when two different homegroups are created inside the same network.

HomeGroup Credentials messages are sent within the HomeGroup Record format (section 2.2.2.2), where the following elements are specified:

- The value of the <RECORDSOURCE> element is set to {929CB323-C5EA-48E7-A6D0-193DD432E769}.
- The value of the <PERSIST> element is set to 1.

The <HOMEGROUP\_DATA> element is populated with the HomeGroup Credentials message content in the following manner:

```
<?xml version="1.0" encoding="utf-8"?><xs:schema id="NewDataSet" xmlns=""
xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns:msdata="urn:schemas-microsoft-com:xml-
msdata"> <xs:element name="HOMEGROUP_DATA"> <xs:complexType> <xs:sequence>
<xs:element name="USERNAME" type="xs:string" minOccurs="1" /> <xs:element
name="PASSWORD" type="xs:string" minOccurs="1" /> <xs:element name="ACCOUNTCREATED"
type="xs:string" minOccurs="1" /> </xs:sequence> </xs:complexType> </xs:element>
<xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
<xs:complexType> <xs:choice minOccurs="0" maxOccurs="unbounded"> <xs:element
ref="HOMEGROUP_DATA" /> </xs:choice> </xs:complexType> </xs:element></xs:schema>
```

**USERNAME:** MUST be set to HomeGroupUser\$.

**PASSWORD:** The binary version of the encrypted password, as described in section 3.1.4.5.5.

**ACCOUNTCREATED:** The Int64 representation of a FILETIME structure that represents the creation time of the account described in [MS-FSCC]. The value is the same for all homegroup members.

### 2.2.2.2.2 HomeGroup User Info Record

HomeGroup User Info records<6> are used to broadcast information about each user on the machine to other machines in the homegroup. Each user account on each homegroup machine has a separate, corresponding HomeGroup User Info record in the PeerGroup.

```
<?xml version="1.0" encoding="utf-16"?>
<xs:schema id="NewDataSet" xmlns=""
```

```

xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns:msdata="urn:schemas-microsoft-
com:xml-msdata">
<xs:element name="propertyStore">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="property" minOccurs="3" maxOccurs="9">
        <xs:complexType>
          <xs:attribute name="type" type="xs:string" use="required"/>
          <xs:sequence>
            <xs:element name="value" type="xs:string" minOccurs="1" maxOccurs="1"/>
            <xs:element name="key" minOccurs="1" maxOccurs="1">
              <xs:complexType>
                <xs:sequence>
                  <xs:element name="guid" type="xs:string" minOccurs="1" maxOccurs="1"/>
                  <xs:element name="pid" type="xs:string" minOccurs="1" maxOccurs="1"/>
                </xs:sequence>
              </xs:complexType>
            </xs:element>
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
<xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
  <xs:complexType>
    <xs:choice minOccurs="1" maxOccurs="1">
      <xs:element ref="propertyStore" />
    </xs:choice>
  </xs:complexType>
</xs:element>
</xs:schema>

```

**property:** A generic property consisting of a property identifier/value pair as described in [MS-OLEPS] section 1.3.2.

**property.type:** A numeric representation of the data type for the value contained in the <property> element. The specified number corresponds to a **Property Type** value as described in [MS-OLEPS] section 2.14.1.

**property.value:** A string representation of the value of the property specified in the <property> element.

**property.key:** The property key corresponding to the value of the <property.value> element.

**property.guid:** The FMTID representation of the value of the <property.key> element as described in [MS-OLEPS]. The FMTID is a string formatted as a GUID as defined in [MS-DTYP] section 2.3.4.3.

**property.pid:** The string representation of a numerical value that specifies the property identifier for this property as described in [MS-OLEPS]. Each HomeGroup User Info record contains the following properties, three of which are required; the remaining properties are optional.

FMTID	Description	PID	Type	Required
{705D8364-7547-468C-8C88-84860BCBED4C}	The account name for the user.	2	VT_LPWSTR (0x001F)	Yes
{28636AA6-953D-11D2-B5D6-00C04FD918D0}	The name of the computer on which this user account resides.	5	VT_LPWSTR (0x001F)	Yes
{705D8364-7547-468C-8C88-84860BCBED4C}	The security identifier for this user account.	18	VT_BLOB (0x0041)	Yes

FMTID	Description	PID	Type	Required
{705D8364-7547-468C-8C88-84860BCBED4C}	The display name for this user account.	9	VT_LPWSTR (0x001F)	No
{705D8364-7547-468C-8C88-84860BCBED4C}	The UserTileData structure associated with this user account, as specified in section 2.2.2.2.2.1.	24	VT_BLOB (0x0041)	No
{7d683fc9-d155-45a8-bb1f-89d19bcb792f}	The display name for the connected identity associated with this user account.	100	VT_LPWSTR (0x001F)	No
{6d6d5d49-265d-4688-9f4e-1fdd33e7cc83}	The security identifier corresponding to the connected identity associated with this user account.	100	VT_LPWSTR (0x001F)	No
{74a7de49-fa11-4d3d-a006-db7e08675916}	The ID of the provider that created the connected identity associated with this user account.	100	VT_CLSID (0x0048)	No
{2b1b801e-c0c1-4987-9ec5-72fa89814787}	The email address corresponding to the connected identity associated with this user account.	100	VT_LPWSTR (0x001F)	No

### 2.2.2.2.1 UserTileData Structure

The **UserTileData** structure contains the image data that represents a user's tile, or picture, in Windows. The structures defined in sections 2.2.2.2.2.1 through 2.2.2.2.2.5 specify the image information, and the device-independent bitmap (DIB) data is also provided in section 2.2.2.2.2.5.

When a user joins the homegroup, the **UserTileData** information is added to enable other machines in the homegroup to correctly display the user's tile.

The **UserTileData** structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Version																															
NumberPictureElements																															
PictureElement1 (variable)																															
...																															
PictureElementN (variable)																															
...																															

**Version (4 bytes):** Contains the version number for this homegroup user info message. It MUST contain a value of 0x0001.

**NumberPictureElements (4 bytes):** Specifies the number of PictureElements (section 2.2.2.2.2.2) in this message.

**PictureElement1 (variable):** The value MUST contain the first PictureElement.

**PictureElementN (variable):** An ordered list of PictureElements that compose this message. Each PictureElement is of variable size and MUST follow the format specified in section 2.2.2.2.2.

### 2.2.2.2.2 PictureElement Structure

The **PictureElement** structure provides information about the image data contained in the UserTileData structure (section 2.2.2.2.1).

The **PictureElement** structure has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Type																															
Length																															
Data (variable)																															
...																															
...																															

**Type (4 bytes):** Specifies the type of **PictureElement**. It MUST be one of the following values.

Name	Value
PictureFormatName (section 2.2.2.2.3)	0x0
PictureFormatData (section 2.2.2.2.5)	0x1
PictureFormatSource (section 2.2.2.2.4)	0x2

**Length (4 bytes):** A 32-bit unsigned integer that MUST indicate the length, in bytes, of the **Data** field.

**Data (variable):** A variable-length field with size equal to the value of the **Length** field. The **Data** field contains the structure information that corresponds to the value of the **Type** field. The size of the **Data** field corresponds to the size of the specified structure as follows:

Name	Value
PictureFormatName (section 2.2.2.2.3)	8 bytes
PictureFormatData (section 2.2.2.2.5)	14 bytes, plus a device-independent bitmap of variable length
PictureFormatSource (section 2.2.2.2.4)	Variable length

### 2.2.2.2.3 PictureFormatName Structure

The **PictureFormatName** structure represents the image type of the UserTileData structure (section 2.2.2.2.1). This structure SHOULD contain the bytes included in the following

diagram exactly as shown. These bytes are the byte representation of the Unicode string "bmp" for bitmap.

**PictureFormatName** is a PictureElement structure (section 2.2.2.2.2) type that has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31								
0x62										0x00										0x6D										0x00									
0x70										0x00										0x00										0x00									

#### 2.2.2.2.4 PictureFormatSource Structure

The **PictureFormatSource** structure provides information about the original user tile image described in the UserTileData structure (section 2.2.2.2.1).

**PictureFormatSource** is a PictureElement structure (section 2.2.2.2.2) type that has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
SourcePath (variable)																															
...																															

**SourcePath (variable):** A Unicode string of variable length that represents an absolute file path to the original user tile image. The string includes the terminating NULL character.

#### 2.2.2.2.5 PictureFormatData Structure

The **PictureFormatData** structure provides the DIB data for the user tile image described by the UserTileData structure (section 2.2.2.2.1).

**PictureFormatData** is a PictureElement structure (section 2.2.2.2.2) type that has the following format.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
0x42										0x4D										Length											
...										0x00										0x00											
0x00										0x00										Offset											
...										DeviceIndependentBitmap (variable)																					
...																															

**Length (4 bytes):** A 32-bit unsigned integer that MUST indicate the length, in bytes, of this structure.

**Offset (4 bytes):** A 32-bit unsigned integer that MUST indicate the offset, in bytes, from the beginning of this structure to the **DeviceIndependentBitmap** field.

**DeviceIndependentBitmap (variable):** An image stored in DIB format as defined in [MS-WMF] section 2.2.2.9.

### 2.2.2.2.3 HomeGroup MAC Address

HomeGroup MAC Address messages are used to broadcast the MAC addresses of all network adapters present in a homegroup member machine to all other members of the homegroup.

HomeGroup MAC Address messages are sent in the HomeGroup Record format (section 2.2.2.2), where the following elements are specified:

- The value of the <RECORDSOURCE> element is set to {A7BC622E-8238-4E38-9C88-34153B7D9AB1}.
- The value of the <PERSIST> element is set to 0.

The <HOMEGROUP\_DATA> element is populated with the HomeGroup MAC Address message content in the following manner:

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="NewDataSet" xmlns="" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:msdata="urn:schemas-microsoft-com:xml-msdata">
  <xs:element name="HOMEGROUP_RECORD">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="MACADDRESSES" type="xs:string" minOccurs="1" />
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element ref="HOMEGROUP_RECORD" />
      </xs:choice>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

**MACADDRESSES:** This element contains the MAC addresses of all of the network cards on the machine. It is a string of binaryized 6-byte MAC addresses, which consists of two terminating NULL characters. Each MAC address is a binary string that contains a terminating NULL character. The last MAC address is followed by a double NULL. The resulting string is Base64 encoded with beginning and ending certificate headers as described in [RFC3548].

### 2.2.2.2.4 Data Protection Listener

The Data Protection Listener<7> enables a user to back up their data to a different device from the device where it is currently located. This feature allows the user to recover data if the original copy is damaged.

Data protection is intended to be a backup solution for home users. One of the objectives of data protection is to enable multiple users in a single household to share the same external device. To achieve this goal, the HomeGroup infrastructure is used. A user on one PC configures an external device and selects to share that device within the homegroup. The sharing of the device creates a

folder on the external device with a Universal Naming Convention (UNC) share to the folder, and broadcasts a message containing information about the UNC share in the homegroup. The UNC share is then visible to all users across all PCs within the homegroup. Users can then select the shared device and specify it as the location where all data is to be sent for backup.

The broadcast message contains the GUID {ADBCFEA5-D8FC-4a46-B12B-EB1FFE39BF17}.

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:element name="DPSharedTargetInfo" >
  <xs:complexType>
    <xs:sequence>
      <xs:element name="SchemaVersion" type="xs:int" minOccurs="1" maxOccurs="1" />
      <xs:element name="TargetUNC" type="xs:string" minOccurs="1" maxOccurs="1" />
      <xs:element name="FriendlyName" type="xs:string" minOccurs="1" maxOccurs="1" />
      <xs:element name="UserName" type="xs:string" minOccurs="1" maxOccurs="1" />
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

**SchemaVersion:** The version number of the schema defined for the broadcast message.

**TargetUNC:** The UNC path of the share which is accessible only to users in the homegroup. Users can select this UNC share as the external device to use for data protection, that is, the device where all of the user data is sent for backup.

**FriendlyName:** A name that is used by all users in the homegroup to refer to the shared device.

**UserName:** The name of the user who originally configured and shared the device in the homegroup. This user knows which physical device has the UNC share.

### 2.2.2.2.5 HomeGroup Signing Key

HomeGroup Signing Key messages are used to distribute signing keys to the homegroup. The signing keys are used to verify the integrity of signed WSD messages that are sent by homegroup members over WSD.

HomeGroup Signing Key messages are sent within the HomeGroup Record format (section 2.2.2.2), where the following elements are specified:

- The value of the <RECORDSOURCE> element is set to {CA328F46-E759-4399-82AB-FA92651D1ED2}.
- The value of the <PERSIST> element is set to 1.

The <HOMEGROUP\_DATA> element is populated with the HomeGroup Signing Key message content in the following manner:

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema id="NewDataSet" xmlns="" xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:msdata="urn:schemas-microsoft-com:xml-msdata">
  <xs:element name="HOMEGROUP_DATA">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="SIGNINGKEYS" type="xs:string" minOccurs="1" />
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
      <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element ref="HOMEGROUP_DATA" />
      </xs:choice>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

```

    </xs:choice>
  </xs:complexType>
</xs:element>
</xs:schema>

```

**SIGNINGKEYS:** The binary version of the encrypted signing key, which is encrypted as specified in section 3.1.4.5.5.

The binary <SIGNINGKEYS> element is sent in the following data format:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31																		
0x2D										0x00										0x2D										0x00																			
0x2D										0x00										0x2D										0x00																			
0x2D										0x00										0x42										0x00																			
0x45										0x00										0x47										0x00																			
0x49										0x00										0x4E										0x00																			
0x20										0x00										0x43										0x00																			
0x45										0x00										0x52										0x00																			
0x54										0x00										0x49										0x00																			
0x46										0x00										0x49										0x00																			
0x43										0x00										0x41										0x00																			
0x54										0x00										0x45										0x00																			
0x2D										0x00										0x2D										0x00																			
0x2D										0x00										0x2D										0x00																			
0x2D										0x00										0x0D										0x00																			
0x0A										0x00										EncodedKeyBlob (3260 bytes)																													
...																																																	
...																																																	
...																0x2D										0x00																							
0x2D										0x00										0x2D										0x00																			

0x2D	0x00	0x2D	0x00
0x45	0x00	0x4E	0x00
0x44	0x00	0x20	0x00
0x43	0x00	0x45	0x00
0x52	0x00	0x54	0x00
0x49	0x00	0x46	0x00
0x49	0x00	0x43	0x00
0x41	0x00	0x54	0x00
0x45	0x00	0x2D	0x00
0x2D	0x00	0x2D	0x00
0x2D	0x00	0x2D	0x00
0x0D	0x00	0x0A	0x00

**EncodedKeyBlob (3260 bytes):** This MUST be generated by the following procedure:

1. Randomly generate a 2048-bit RSA key pair and encode it as an **RSAKeyBlob** structure as specified in section 2.2.2.2.5.1. The RSA algorithm is specified in [RFC3447] and recommended methods for generating RSA keys are described in [FIPS186].
2. Generate a 256-bit AES key [FIPS197] by concatenating the homegroup GUID and the homegroup password and hashing the result with the SHA-256 algorithm [FIPS180-3]. In this procedure, the homegroup GUID is represented in the Curly-Braced String Representation specified in [MS-DTYP] section 2.3.4.3 and encoded as a Unicode string in little-endian UTF-16 encoding with the terminating NULL character and the homegroup password is represented as a Unicode string in little-endian UTF-16 encoding with the terminating NULL character.
3. Encrypt the **RSAKeyBlob** generated in Step 1 with the AES key generated in Step 2, using the AES-256 block cipher [FIPS197] in Cipher Block Chaining mode [SP800-38A] with a zero Initialization Vector (IV).
4. Encode the result from Step 3 with the Base64 encoding scheme specified in [RFC4648] section 4, with a 64-bit line length and a terminating line feed. Note that line feeds are CR-LF combinations.
5. Represent the result from Step 4 as a Unicode string in little-endian UTF-16 encoding.

#### 2.2.2.2.5.1 RSAKeyBlob Structure

This section provides the definition for the **RSAKeyBlob** structure that is used to encode the value of the **EncodedKeyBlob** field of the HomeGroup Signing Key messages defined in section 2.2.2.2.5.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

Coefficient (128 bytes)																															
...																															
...																															
Private Exponent (256 bytes)																															

...
...

**Public Exponent (4 bytes):** This MUST be a 32-bit unsigned number in little-endian format. It MUST be the public exponent of the key pair, which is referred to as **e** in [RFC3447] section 2.

**Modulus (256 bytes):** This MUST be the RSA modulus, which is referred to as **n** in [RFC3447] section 2. It MUST be equal to **Prime1** \* **Prime2**. It MUST be encoded in little-endian format.

**Prime1 (128 bytes):** This MUST be the first prime factor of the RSA modulus, which is referred to as **p** in [RFC3447] section 2. It MUST be encoded in little-endian format.

**Prime2 (128 bytes):** This MUST be the second prime factor of the RSA modulus, which is referred to as **q** in [RFC3447] section 2. It MUST be encoded in little-endian format.

**Exponent1 (128 bytes):** This MUST be the Chinese Remainder Theorem exponent of **Prime1**, which is referred to as **dP** in [RFC3447] section 2. It MUST be encoded in little-endian format.

**Exponent2 (128 bytes):** This MUST be the Chinese Remainder Theorem exponent of **Prime2**, which is referred to as **dQ** in [RFC3447] section 2. It MUST be encoded in little-endian format.

**Coefficient (128 bytes):** This MUST be the Chinese Remainder Coefficient of **Prime1** and **Prime2**, which is referred to as **qInv** in [RFC3447] section 2. It MUST be encoded in little-endian format.

**Private Exponent (256 bytes):** This MUST be the RSA private exponent, which is referred to as **d** in [RFC3447] section 2. It MUST be encoded in little-endian format.

## 3 Protocol Details

### 3.1 Homegroup Member Details

#### 3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

To implement the HomeGroup Protocol, an individual homegroup member stores and updates the data about itself, as well as the data about other members of the homegroup, which is necessary for sending the messages specified in section 2. Whenever the data maintained by the machine changes, the messages in section 2 SHOULD be re-sent. Resending the messages ensures that new information is propagated to all members of the homegroup.

**Note** The homegroup password is required to join a homegroup, but is never transmitted by this protocol.<8>

#### 3.1.2 Timers

None.

#### 3.1.3 Initialization

This protocol is initialized when a machine creates or joins a homegroup. When this protocol is first initialized, the machine SHOULD check for the HomeGroup Invitation WSD message (section 2.2.1.1). If a HomeGroup Invitation is detected, then the machine MAY join the homegroup, as described in section 3.1.4.2.

If no invitation is detected, then the machine MAY create a homegroup, as described in section 3.1.4.1.

#### 3.1.4 Higher-Layer Triggered Events

##### 3.1.4.1 Creating the Homegroup

To participate in a homegroup, a machine MUST create the homegroup when a HomeGroup Invitation message (section 2.2.1.1) does not exist. This requires a homegroup password. All other machines will then be able to join the homegroup when the first machine's HomeGroup Invitation is detected.

A new homegroup is created by creating a new PeerGroup with a secure Peer ID [MS-PPSEC]. The Peer ID is a unique identifier that other members in the PeerGroup can use to identify a particular member [MS-PPSEC]. The machine then generates the signing keys, as described in section 3.1.4.5.2. The machine MUST then take the following actions:

- Send a HomeGroup Signing Key message (section 2.2.2.2.5), a HomeGroup Member Info message (section 2.2.2.1), a HomeGroup User Info record (section 2.2.2.2.2) for each user on the machine, a HomeGroup Credentials message (section 2.2.2.2.1), and a HomeGroup MAC Address message (section 2.2.2.2.3) to the PeerGroup. If the data contained in a message changes, the machine MUST create new messages and send them to the PeerGroup.

- Publish a HomeGroup Invitation WSD message (section 2.2.1.1). If the data contained in the HomeGroup Invitation WSD message changes, the machine MUST create a new HomeGroup Invitation WSD message and publish it on the WSD channel.
- When a printer is attached to the machine that is to be shared, the machine SHOULD also publish a HomeGroup Printer WSD message (section 2.2.1.2) on the WSD channel. If the printer is unshared, the machine SHOULD remove the printer from the HomeGroup Printer WSD message.
- If a new user is created on the machine, a HomeGroup User Info record (section 2.2.2.2) MUST be sent to the PeerGroup for that user account. If a user is deleted from the machine, the HomeGroup User Info record corresponding to that user account MUST be removed from the PeerGroup.

There is no required order for sending or publishing these messages.

### 3.1.4.2 Joining the Homegroup

Joining an existing homegroup requires the presence of a HomeGroup Invitation message. Multiple HomeGroup Invitation messages can be present on the network.<9> When a HomeGroup Invitation message has been detected, the machine MUST use the PeerGroup invitation located in the <INVITATION> element of the HomeGroup Invitation message (section 2.2.1.1), as well as the homegroup password, to join the PeerGroup.

The machine joins the PeerGroup in the manner described in [MS-PPSEC] section 3.1.4.3. Once the machine has joined the PeerGroup, it is considered a member of the homegroup.<10>

After joining the PeerGroup, the machine MUST then take the following actions:

- Send a HomeGroup Signing Key message (section 2.2.2.2.5), a HomeGroup Member Info message (section 2.2.2.1), a HomeGroup User Info record (section 2.2.2.2) for each user on the machine, and a HomeGroup MAC Address message (section 2.2.2.3) to the PeerGroup. If the data contained in a message changes, the machine MUST create new messages and send them to the PeerGroup.
- Publish a HomeGroup Invitation WSD message (section 2.2.1.1). If the data contained in the HomeGroup Invitation WSD message changes, the machine MUST create a new HomeGroup Invitation WSD message and publish it on the WSD channel.
- When a printer is attached to the machine that is to be shared, the machine SHOULD also publish a HomeGroup Printer WSD message (section 2.2.1.2) on the WSD channel. If the printer is unshared, the machine SHOULD remove the printer from the HomeGroup Printer WSD message.
- If a new user is created on the machine, a HomeGroup User Info record (section 2.2.2.2) MUST be sent to the PeerGroup for that user account. If a user is deleted from the machine, the HomeGroup User Info record corresponding to that user account MUST be removed from the PeerGroup.

### 3.1.4.3 Departing the Homegroup

To depart from the homegroup, the machine MUST remove all messages that it sent to the PeerGroup from the group [MS-PPGRH], except those that are flagged to persist after the machine's departure, as described in sections 2.2.2.2.1 and 2.2.2.2.5 and [MS-PPGRH].

The machine MUST stop publishing the HomeGroup Invitation WSD message and, if applicable, the HomeGroup Printer WSD message.

The machine MAY then close and delete the PeerGroup [MS-PPGRH].<11>

### 3.1.4.4 Changing the Homegroup Password

Changing the homegroup password is accomplished by departing the homegroup and creating a new homegroup with the new password.

To change the homegroup password, the machine departs the homegroup, as described in section 3.1.4.3. The machine then creates a new homegroup, as described in section 3.1.4.1. When doing so, both the GUIDNAME name and the signing keys MUST be reused from the departed homegroup. This is done so that when the new homegroup broadcasts its invitation, it will contain the old homegroup name and the digital signature will be signed with the signing keys of the previous homegroup.

The other homegroup machines then detect the new HomeGroup Invitation WSD message and can join the homegroup by supplying the new password, as described in section 3.1.4.2.

### 3.1.4.5 Message Signing and Encryption

#### 3.1.4.5.1 Encryption Key

An encryption key is generated when a homegroup is created. The key is formed as specified in the description for the EncodedKeyBlob structure (step 2) in section 2.2.2.2.5.

This encryption key is used to encrypt the HomeGroup Credentials message (section 2.2.2.2.1) account credentials, as well as the public/private signing keys, before sending over the network.

#### 3.1.4.5.2 Public/Private Signing Keys

The creator of the homegroup generates a 2048-bit RSA key pair, as specified in [RFC3447] and [PKCS1].

These keys are encrypted, as described in section 3.1.4.5.5, and sent to the other members of the homegroup over the PeerGroup channel via a HomeGroup Signing Key message (section 2.2.2.2.5).

The keys are used to sign or verify the integrity of signed WSD messages sent over the homegroup.

#### 3.1.4.5.3 WSD Hash

HomeGroup Invitation messages (section 3.1.5.1) are hashed. This hash is signed with the HomeGroup signing key and the signed version is included in the message in the <DIGITALHASH> element.

The hash is an SHA-256 hash of the following values in the order specified:

- <NETWORKNAME> (if it contains a value)
- <GUIDNAME>
- <OWNER> (if it contains a value)
- <OWNERID> (if it contains a value)
- <OWNERMACHINENAME> (if it contains a value)
- <LASTCHANGED>
- <HOMEGROUPSIZE>
- <ADDRESS>

This hash is computed, as specified in [FIPS180-3]. The optional fields are ignored when they do not contain a value. The hash is then signed with the public signing key described in section 3.1.4.5.2, using the RSASSA-PKCS1-v1\_5 signature algorithm specified in [PKCS1] section 8.2.

#### **3.1.4.5.4 Printer Messages**

HomeGroup Printer messages are signed with the public signing key, described in section 3.1.4.5.2, using the RSASSA-PKCS1-v1\_5 signature algorithm specified in [PKCS1] section 8.2.

#### **3.1.4.5.5 Encrypting HomeGroup Credentials, Signing Key and MAC Address**

The <PASSWORD> element in the HomeGroup Credentials message and the <SIGNINGKEYS> element in the HomeGroup Signing Key message are encrypted using the Encryption Key (section 3.1.4.5.1) with the AES-256 algorithm [FIPS197] in Cipher Block Chaining mode [SP800-38A] with a zero Initialization Vector (IV).

### **3.1.5 Processing Events and Sequencing Rules**

#### **3.1.5.1 HomeGroup Invitation Messages**

When a HomeGroup Invitation message is received by a machine that is not a member of the homegroup, the machine will not be able to verify the HomeGroup Invitation message. Instead, the machine can join the homegroup using the HomeGroup Invitation message as described in section 3.1.4.2.

When a HomeGroup Invitation message is received by a machine that is currently a member of the homegroup, the message hash SHOULD be verified using the RSASSA-PKCS1-v1\_5 signature algorithm specified in [PKCS1] section 8.2. Once the HomeGroup Invitation message is verified, if the value of the <GUIDNAME> element for the message matches the <GUIDNAME> value for the current homegroup, and if the value of the <LASTCHANGED> element for the message is newer than the <LASTCHANGED> value for the current homegroup, then a password reset condition is detected and the machine MUST change the password as defined in section 3.1.4.4.

#### **3.1.5.2 Printer Messages**

When a Printer message is received, it MUST be decoded from Base64, as described in [RFC3548], and SHOULD then be verified using the RSASSA-PKCS1-v1\_5 signature algorithm, specified in [PKCS1] section 8.2.

Once verified, the machine SHOULD add the printer as described in [MS-RPRN].

#### **3.1.5.3 HomeGroup Credentials and Signing Key Messages**

Whenever a HomeGroup Credentials message or a HomeGroup Signing Key message is received, its encrypted fields MUST be decrypted using the Encryption Key (section 3.1.4.5.1) with the AES-256 algorithm [FIPS197] in Cipher Block Chaining mode [SP800-38A] with a zero Initialization Vector (IV).

#### **3.1.6 Timer Events**

None.

#### **3.1.7 Other Local Events**

For the purposes of participating in this protocol, any messages that are received over WSD or PeerGroup that do not conform to the message formats described in section 2 SHOULD be ignored.

## 4 Protocol Examples

### 4.1 HomeGroup Invitation

The following is an example of a WSD HomeGroup message that uses the layout of the HomeGroup Invitation message (section 2.2.1.1).

```
<HOMEGROUP_RECORD>
<INVITATION>
&lt;PEERINVITATIONVERSION="1.1"&gt;&lt;CLOUDNAME&gt;LinkLocal_ff00::%10/8&lt;/C
LOUDNAME&gt;&lt;SCOPE&gt;LINKLOCAL&lt;/SCOPE&gt;&lt;CLOUDFLAGS&gt;1&lt;/CLOUDFL
AGS&gt;&lt;GROUPPEERNAME&gt;2bcba40abd09492eb706b74f8f8932a6efb10979.HomeGroupP
eerGroupClassifier&lt;/GROUPPEERNAME&gt;&lt;GROUPFRIENDLYNAME&gt;HomeGroup Peer
Group&lt;/GROUPFRIENDLYNAME&gt;&lt;/PEERINVITATION&gt;
</INVITATION>
<NETWORKNAME>
2PC-airlinkN
</NETWORKNAME>
<GUIDNAME>
{A4C99DD2-EF9E-4447-89DC-19BF65323D19}
</GUIDNAME>
<OWNER>
DT1
</OWNER>
<OWNERID>
f8f4182fd7302b07a7d1aeae3cb2b69adaa9d595.HomeGroupClassifier_1
</OWNERID>
<OWNERMACHINENAME>
KYLEDELL32C-PC
</OWNERMACHINENAME>
<LASTCHANGED>
128907808427918671
</LASTCHANGED>
<HOMEGROUPSIZE>
5
</HOMEGROUPSIZE>
<ADDRESS>
[fe80::b424:f131:8bcc:b134%12]:3587
</ADDRESS>
<DIGITALHASH>

CaHtY6vD22wKYYXdU7OjoQ==
-----END CERTIFICATE-----
</DIGITALHASH>
</HOMEGROUP_RECORD>
```

The following are some points to consider regarding specific elements of this message.

- **NETWORKNAME:** A value of "2PC-airlinkN" indicates that at least one of the machines in the HomeGroup is connected wirelessly; otherwise, the value would be NULL.
- **HOMEGROUPSIZE:** Indicates the number of homegroup members which in this case is five.
- **INVITATION:** Supplies the invitation to the actual PeerGroup, which has been generated according to the Peer-to-Peer Grouping Security Protocol Specification [MS-PPSEC].
- **DIGITALHASH:** Provides an example of the hashed certificate.

## 4.2 HomeGroup Member Info

The following is an example HomeGroup Member Info message (section 2.2.2.1).

```
<?xml version="1.0" encoding="UTF-16"?><HOMEGROUP_RECORD>
<COMPUTERNAME>MICHMCK2</COMPUTERNAME>      <PEERID>
f0eb97049320127acd2a8f4990a389c3725a7a08.HomeGroupClassifier</PEERID>
<RECORDID>{00000000-0000-0000-0000-000000000000}</RECORDID>
  <property type="19">      <name>OSVersion</name>      <value>100794368</value>
</property>      <property type="11">      <name>DomainJoined</name>      <value>0</value>
</property>
</HOMEGROUP_RECORD>
```

## 4.3 HomeGroup Credentials

The following is an example of a HomeGroup Credentials Message (section 2.2.2.2.1)).

```
<?xml version="1.0" encoding="UTF-16"?>
<HOMEGROUP_RECORD>
<VERSION>1</VERSION>
<RECORDSOURCE>{929CB323-C5EA-48E7-A6D0-193DD432E769}</RECORDSOURCE>

## 5 Security

### 5.1 Security Considerations for Implementers

The HomeGroup Protocol relies partially on the Peer-to-Peer Grouping Security Protocol [MS-PPSEC] to secure the PeerGroup traffic. Encryption and hashing within the sent messages is achieved through open cryptographic standards.

### 5.2 Index of Security Parameters

Security parameter	Section
<DIGITALHASH>	Section 2.2.1.1
<PASSWORD>	Section 2.2.2.2.1
<SIGNINGKEYS>	Section 2.2.2.2.5
Message Signing and Encryption	Section 3.1.4.5

## 6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include ~~released service packs~~updates to those products.

- Windows 7 operating system
- Windows Home Server 2011 server software
- Windows 8 operating system
- Windows 8.1 operating system
- Windows 10 operating system

Exceptions, if any, are noted ~~below in this section~~. If ~~a-an update version~~, service pack or ~~Quick-Fix Engineering (QFE)~~Knowledge Base (KB) number appears with ~~thea~~ product ~~version, name, the~~ behavior changed in that ~~service pack or QFE update~~. The new behavior also applies to subsequent ~~service packs of the product~~updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 1.3: In Windows the protocol excludes the relationship to machines that exist on the same subnet.

<2> Section 1.3: This protocol is disabled in Windows 10 v1803 operating system.

<3> Section 2.2.2.1: The <property> element is optional. It is not supported in Windows 7 and Windows Home Server 2011.

<4> Section 2.2.2.1: The HomeGroup Member Info record contains the following two properties. To maintain backwards compatibility with the HomeGroup Member Info record available in Windows 7, these two properties are defined as optional. They are not supported in Windows Home Server 2011.

Property name	Description	Type
OSVersion	A 32-bit, unsigned integer representing the version number of the operating system. When this property is not set, the value is considered to be the OSVersion number for Windows 7 (0x0601).	VT_UI4 (0x0013)
DomainJoined	A Boolean value that indicates whether the machine is joined to the domain. A value of 1 indicates that the machine is joined to the domain; otherwise, the value is set to 0.	VT_BOOL (0x000B)

<5> Section 2.2.2.2.1: In Windows every homegroup member has a common user account with the same password, which is used to authenticate between members of the homegroup.

<6> Section 2.2.2.2.2: The HomeGroup User Info record is not supported in Windows 7 and Windows Home Server 2011.

<7> Section 2.2.2.2.4: The Data Protection Listener is not supported in Windows 7 and Windows Home Server 2011.

<8> Section 3.1.1: In Windows, this password can be auto-generated by the machine that is creating the homegroup, or supplied by a user.

<9> Section 3.1.4.2: In Windows, if more than one HomeGroup Invitation message is found, then the protocol will attempt to join the PeerGroup specified in each HomeGroup Invitation until successful. The order in which the HomeGroup Invitation messages are processed is undefined.

<10> Section 3.1.4.2: In Windows, after the PeerGroup invitation has been issued, the machine then collects and stores the information from the HomeGroup Credentials message and the HomeGroup MAC address message, as well as from the signing keys found in the HomeGroup Signing Key message.

<11> Section 3.1.4.3: In Windows, the machine closes and deletes the Peergroup after departing the homegroup when it is the last member of the homegroup. In the case where the password change has occurred and the machine is not the last member of the homegroup, the homegroup is not closed and deleted.

## 7 Change Tracking

No table of changes is available. The document is either new or has had no changes since its last release.
