

[MS-RDPEUDP]: Remote Desktop Protocol: UDP Transport Extension

This topic lists the Errata found in [MS-RDPEUDP] since it was last published. Since this topic is updated frequently, we recommend that you subscribe to these RSS or Atom feeds to receive update notifications.

Errata are subject to the same terms as the Open Specifications documentation referenced.

Errata below are for Protocol Document Version [V14.0 – 2020/03/04](#).

Errata Published*	Description																																																																																																																																																																																																
2020/07/06	<p>In Section 2.2.2.6 RDPUDP_ACK_OF_ACKVECTOR_HEADER Structure, revised the field snAckofAcksSeqNum to snResetSeqNum, and updated its description.</p> <p>Changed from:</p> <p>The RDPUDP_ACK_OF_ACKVECTOR_HEADER structure resets the start position of an ACK vector (section 2.2.3.1).</p> <table border="1" data-bbox="402 837 1292 978"> <tr> <td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td> <td>1</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td> <td>2</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td> <td>3</td><td>1</td> </tr> <tr> <td colspan="10"></td> <td>0</td><td colspan="10"></td><td>0</td><td colspan="10"></td><td>0</td><td>1</td> </tr> <tr> <td colspan="30" style="text-align: center;">snAckofAcksSeqNum</td> </tr> </table> <p>The sender sets the AckOfAck sequence number with the greatest cumulative ACK it has received and processed. 2020/07/06	<p>In Section 2.2.2.7 RDPUDP_ACK_VECTOR_HEADER Structure, revised structure description, field AckVectorElement to AckVector and added normative information to field definitions.</p> <p>Changed from:</p> <p>The RDPUDP_ACK_VECTOR_HEADER structure contains the ACK vector (section 2.2.3.1) that specifies the states of the datagram in the receiver's queue. This vector is a variable-size array. The states are encoded by using run-length encoding (RLE) and are stored in this array.</p>																																																																																																																																																																																																

Errata Published*	Description
-------------------	-------------

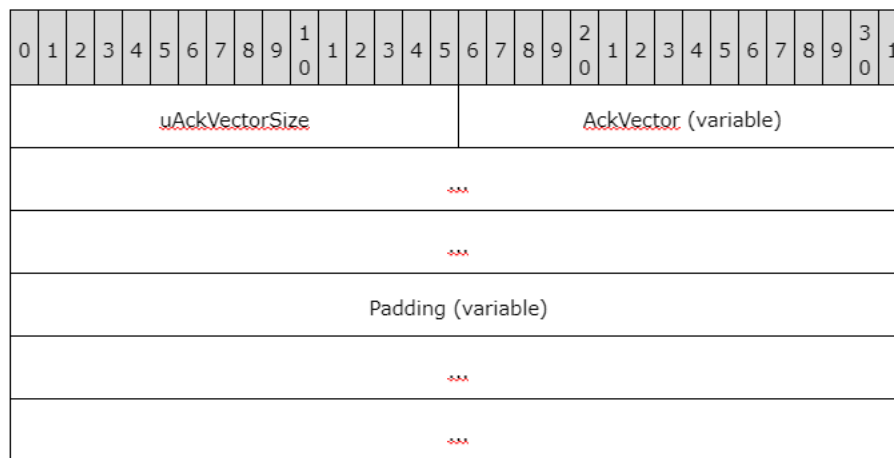

AckVectorElement (variable): An array of ACK Vector elements. Each element is composed of a state, and the number of contiguous datagrams that share the same state.

Padding (variable): A variable-sized array, of length zero or more, such that this structure ends on a DWORD ([MS-DTYP] section 2.2.9) boundary.

Changed to:

The RDPUDP_ACK_VECTOR_HEADER structure contains a variable size array of ACK Vector Elements (section 2.2.2.7.1), referred to as the ACK vector.

The ACK vector captures the state of the queue of Source Packets at the receiver endpoint. Each position in the queue can have two values that indicate whether a Source Packet is present in the queue, or not. Run-length encoding (RLE) compression is used to encode the state of Source Packets in the array.

AckVector (variable): A variable size array of ACK Vector Elements (section 2.2.2.7.1). The size of the AckVector field is specified by the uAckVectorSize field.

Padding (variable): A variable-sized array, of length zero or more, such that this structure ends on a DWORD ([MS-DTYP] section 2.2.9) boundary.

Added section 2.2.2.7.1 ACK Vector Element. ...

An ACK Vector Element is an 8-bit structure. The two most significant bits of each element encode the VECTOR_ELEMENT_STATE enumeration (section 2.2.1.1), while the six least

Errata Published*	Description																																																															
	<p>significant bits specify the length of a continuous sequence of datagrams that share the same state.</p> <p>Removed sections 2.2.3 Vectors & 2.2.3.1 ACK Vector.</p> <p>2.2.3 Vectors</p> <p>2.2.3.1 ACK Vector</p> <p>The ACK vector captures the state of the queue of Source Packets at the receiver endpoint.
